

## **Antenna manufacture PIDSO reaches EN 9100 certification for the aerospace industry**

Vienna, July 2020 - The Austrian high-tech company PIDSO with its headquarters in Vienna enters a new dimension! From now on it belongs to the exclusive circle of less than 70 Austrian companies, which achieve the high requirements in the area of quality management for development, production and maintenance in the aerospace industry by EN 9100.

As a global player in the area of customer specific antenna production with highest technical and qualitative requirements, PIDSO implements the demanding standard EN9100 systematically, uniformly and consequently in the whole company. The strategic development goal of PIDSO is to establish itself as a supplier in the aviation industry. The certification according to EN 9100 underlines the positioning of PIDSO as a high-tech forge.

"The certification is the result of a continuous development of all employees and processes in the company and represents an essential milestone for PIDSO, which already has customers in the aerospace industry", explains CEO Christoph Kienmayer. "With the successfully completed certification and the implemented process management system, the commitment of PIDSO for highest quality and customer satisfaction is shown once more", says managing director DI Dr. techn. Christoph Kienmayer about this success.

The aerospace industry is a highly sensitive sector, where safety, reliability and quality are the top priority. The certification ensures that process flows are regularly checked and improved and that comprehensive risk management is carried out. Thus, it is precisely such a system that supports a high-quality series production of aerospace products and ensures full transparency.

## **About PIDSO**

PIDSO is an Austrian high-tech-company that specializes in the development and manufacture of antennas and antenna systems. The company offers specialized expertise in the manufacture of lightweight antennas and the integration of antennas into existing building spaces. Its performance portfolio includes proprietary developments, customer-specific solutions, high frequency simulation and measurement services, and prototype construction. Thanks to the company's distinctive structure, all assembly work and quality assurance are carried out in-house, offering PIDSO customers a unique one-stop solution for high-performance antennas.

You can find more information about PIDSO and its products on [www.pidso.com](http://www.pidso.com)
